FARM EMPLOYMENT UNDER LAST YEAR WAGE RATES HIGHER

About 8.9 million people were at work on farms during the week of June 17-23, the Crop Reporting Board announced today. Of this total, 6.5 million were operators and unpaid members of their families and 2.4 million were hired workers. The number of family workers was 4 percent less than a year earlier and the number of hired workers was 3 percent less.

In comparison with a month earlier, the number of family workers was down 3 percent while the number of hired workers was up about a fifth or about 400,000. The change in the number of family workers was about usual for the season but the increase in the hired workers was less than usual.

Farm wage rates on about July 1 averaged 5 percent more than a year earlier for the country as a whole. The seasonally adjusted index of farm wage rates was 535 percent of the 1910-14 average compared with 510 July 1, 1955. All types of rates for the Nation were higher than a year ago.

On a regional basis, wage rates averaged higher than a year ago in all regions. Increases varied from 2 percent to 7 percent with the largest increase in the New England States. Increases in industrial wage rates probably had the greatest effect in this area. Individual rates were also mostly higher than a year earlier.

Individual types of wage rates for the country as a whole were up from April 1 but the average was up less than usual as indicated by the drop of 1 percent in the seasonally adjusted index. The index indicates that by regions, changes from April were mixed. The index was down in the Middle Atlantic, East and West North Central, East South Central, and the Mountain States but higher in all other regions. The largest changes were the increase in the New England States and the decrease in the West North Central States. Changes in the other regions were about 1 percent or less.

For individual types of rates practically all rates in all regions were up seasonally except in the South Atlantic States. In this region changes were mixed and some individual rates were lower, however, the seasonally adjusted index for this region increased 1 percent.

Weather during the week of June 17-23 was generally favorable for farm work. Temperatures averaged above normal throughout most of the Central and Mountain States and below normal in the rest of the country. Showers in varying amounts were generally well distributed over the Great Lakes Region, over the Gulf and southern Atlantic coastal areas, and along the Canadian Border from western Montana through Minnesota. Rain fell in the extreme Northwest and showers occurred in most of the Great Plains States; however, the dry weather continued in the Southwest.

The major jobs for the country as a whole were harvesting small grains, making hay, and cultivating various crops. Small grain harvest was about over in the southern part of the country and was starting in the southern areas of the East North Central States. Winter wheat harvest was finished in the earlier areas of Texas and well advanced in the Northern High Plains. The wheat harvest is practically completed in the

south central portion of Kansas and has now extended to eastern Colorado, extreme southern Nebraska, northern Missouri, and central portions of Illinois and Virginia. Hay making and crop cultivation were in progress practically everywhere. Cotton hoeing and chopping were proceeding well in the South and the Southwest.

Farmers were harvesting vegetables and fruit in many parts of the country. The peach harvest was in progress in Georgia, Alabama, North and South Carolina. Strawberries were being picked in Michigan, Washington, and Oregon. In California, citrus, peaches, apricots, cherries, berries, and grapes were being harvested.

The total number of persons working on farms in late June was down from a year earlier in all geographic regions except the New England, Mountain, and Pacific States. Each of these regions showed small increases. Decreases in the remaining regions ranged from 2 to 8 percent. The largest drops occurred in the Middle Atlantic and East North Central States. The decline in these regions amounted to 45,000 persons in the Middle Atlantic States and 125,000 persons in the East North Central States.

The decrease in the total number of person doing farm work in late June from a year earlier was due to a decrease in both family and hired workers although the greatest decline occurred in family workers. Decreases in numbers of family workers by regions ranged from 1 to 10 percent except in the New England and Mountain States where slight increases were reported. The decrease was largest in the West South Central States. Most of the decrease was accounted for by this region and the East and West North Central and Middle Atlantic States.

The number of hired workers was down from last year in all regions except the New England, West South Central, and Pacific States where small increases were reported. The decrease in the number of hired workers was greatest in the East North Central States. The decline there amounted to 19 percent or about 54,000 workers. Decreases in the remaining regions ranged from 1 to 10 percent.

For the country as a whole, the number of persons at work on farms increased 3 percent from May to June. This is slightly less than the usual percentage increase. Changes by regions also departed somewhat from the usual seasonal change. In the New England and Pacific States there was a larger than usual seasonal increase while in the Middle Atlantic, East and West North Central, and South Atlantic States, the increase was less than usual. Changes in the East South Central and Mountain States were about the same as usual.

The number of family workers ordinarily declines during June mainly because of decreases in the Southern, the West North Central, and Mountain States. This year the change in the number of family workers for the country as a whole from May to June showed about the usual decline even though the number of workers in the East South Central States showed a slight increase.

The number of hired workers increased from May to June by a little over 400,000 persons. More than two-thirds of this increase was in the North Central and South Atlantic States. Increases were less than usual in the East North Central and South Atlantic States but slightly greater than usual in the West North Central States. There was less than the usual increases in the Middle Atlantic, East North Central, and Mountain States.

1/ Certain wage rates are not estimated because they are relatively unimportant.

2/ Adjusted for seasonal variation.

EXPLANATIONS 1/

Farm employment estimates of the Agricultural Marketing Service cover persons doing farm work on all farms. Mailed questionnaires are received every month from 15,000 to 20,000 farmers who report the number of persons working on their farms during the last complete calendar week, ending at least one day before the end of the month. The Census of Agriculture and interview surveys of farmers are used to provide bench mark data on employment.

All farm operators who spend one hour or more during the survey week at farm work, chores, or in the transaction of farm business are counted as employed. Members of the operator's family or household doing unpaid farm work or chores are counted if they put in 15 hours or more during the week. Operators plus unpaid members of their families or households who meet these criteria are called family workers. All persons doing one or more hours of farm work or chores for pay during the week are counted as hired workers.

The data on farm employment published by the Agricultural Marketing Service differ from those on agricultural employment of the Census in the Monthly Report on the Labor Force because of the differences in the method of approach, in concepts of employment, and in time of the month for which data are collected. The AMS collects information from the farmer on all persons working on his farm during the week regardless of age, or other jobs held by these workers. The Census data are obtained by interview from about 22,000 farm and nonfarm households on the labor force status of the household members 14 years of age and over, for the week including the 12th of the month. In addition, both series are subject to sampling variation and may differ from the results of a complete census.

Wage rates are reported quarterly by the same sample of farm operators that reports employment. The farmer is asked to report average wage rates being paid "at this time" in his locality.

1/ Additional information available in January 1956 issue of Farm Labor.
